

On Adding New Stories/Chapters

1. Save a Markdown file of your new chapter. It should be [name].md. Put it in the stories folder and move it into the folder named after your corresponding story.
 - a. It should look something like stories>story name>Chapter 1.md
2. If it's the first chapter, you will need to save a thumbnail. By default, if you put a png with the same name as the first chapter in the same folder, it should just work.
 - a. Make sure the thumbnail is square. I don't know how other aspect ratios will look.
 - b. It should look something like stories>story name>Chapter 1.png
 - c. Later, I'll have instructions for referencing a png in another folder.
3. If you have an audio file, save it as a WAV and name it the same thing as the corresponding chapter. Put it in the same folder.
4. Exit the stories folder. Run chud.bat. A terminal should come up - wait a couple seconds,
 - a. Once it says something like "all done :3", you can press any key to close the terminal.
5. (Optional, but highly recommended) Open markdownFiles.json in a text editor. Make edits to your heart's content
 - a. To change the title of your story, go to the stories section, go into the section that shares the name of the folder you made earlier, and change the title.

```
"stories": {  
  "title": "stories",  
  "Placeholder Story": {  
    "title": "Placeholder Story",  
    "items": {  
      {  
        "title": "Chapter 1",  
        "date": "12/11/2025",  
        "filepath": "stories/Placeholder Story/Chapter 1.md",  
        "audiopath": "stories/Placeholder Story/Chapter 1.wav",  
        "imagepath": "stories/Placeholder Story/Chapter 1.png",  
        "synopsis": "Fuck. I highkenuinly hate using Lorem Ipsum placeholder text"      }  
    }  
  }  
}
```

- b.
- c. To change the title of your chapter, go into the items section of your story and change the title of your corresponding chapter.

```
"title": "Placeholder Story",  
"items": [  
  {  
    "title": "Chapter 1",  
    "date": "12/11/2025",  
    "filepath": "stories/Placeholder Story/Chapter 1.md",  
    "audiopath": "stories/Placeholder Story/Chapter 1.wav",  
    "imagepath": "stories/Placeholder Story/Chapter 1.png",  
    "synopsis": "Fuck. I highkenuinly hate using Lorem Ipsum placeholder text"  
  },  
  {  
    "title": "Chapter 2!!! I love \"quote marks",  
    "date": "",  
    "filepath": "stories/Placeholder Story/Chapter 2.md",  
    "audiopath": "stories/Placeholder Story/Chapter 2.wav",  
    "imagepath": "",  
    "synopsis": ""  
  }  
]
```

- d.

- e. Note that the order, by default, is in alphabetical order based on the file name. I recommend just naming the files something like “Chapter 1, Chapter 2, Chapter 3”, or just “1, 2, 3, 4, 5”, and then changing their titles later.
- f. You can also change the date - it needs to follow the MM/DD/YYYY format. Anything else will break the index pages.
- g. If it's the first chapter, you'll need to put in something for the synopsis.
- h. If you wanna reference an audio file in another folder, change the audiopath or imagepath fields.

On Adding new Blogs/Updates

1. Save a markdown file of your blog/update. It should be [name].md. Put it in either the blogs or updates folder
2. You'll also need a thumbnail. By default, if you save a png of the same name in the same folder, it should just work.
3. Go back out and run chud.bat. A terminal should come up - wait a couple seconds,
 - a. Once it says something like “all done :3”, you can press any key to close the terminal.
4. Open markdownFiles.json in a text editor.
 - a. Similar logic to editing the info for the chapters - the only other thing is that audiopath doesn't do anything for the blogs/updates sections.

```

"blogs": {
  "root": {
    "title": "root",
    "items": [
      {
        "title": "Blog Post 1",
        "date": "06/12/2026",
        "filepath": "blogs/Blog Post 1.md",
        "audiopath": "",
        "imagepath": "blogs/Blog Post 1.png",
        "synopsis": "Here\u0027s the synopsis of blog post number one!!"
      }
    ]
  }
},

```

- b.
- c. Each blog/update will need a synopsis

On Embedding Images in your Writing

1. Embed images in your markdown file using standard markdown syntax. ![Alt Text for if it doesn't load](URL/filepath)
2. Here's the weird part - I've made it so that, when the markdown files load in the site, the image sources are relative to the folder that your markdown file's in.
 - a. This is mostly for organization - that way, you aren't flooding your entire site with images in random places.
 - b. For example, if I had a folder in my story folder called RecipeImg and I wanted to reference an image in there, I'd use something like ![alt text](RecipeImg/Image_1.png). The actual path for the image would look something like stories>story name>RecipeImg>Image_1.png

Updating the Homepage

1. Open homeInfo.json in a text editor.

```
{  
  "title": "Iced's Writing Website",  
  "description": "Welcome to my website! I hope that you  
  "recentUpdate": "A new update!!",  
  "newBlog": "Blog Post 3",  
  "featuredStory": "Placeholder Story"  
}
```

- 2.
3. Edit the title/description to whatever you want the title/description on your website to say.
4. Set recentUpdate to the title of an update you wanna feature, set newBlog to the title of a blog you wanna feature, and set featuredStory to the title of a story you wanna feature.
 - a. The thumbnail and description for each featured thing should update automatically if the update/blog/story do actually exist
5. Edit mainArt.png in the homeresources folder to change the main art featured there. This should probably stay square too.
 - a. If you want more extensive changes to the homepage, just ping me and I'll see what I can do.

Updating the About/Contact page

1. Open aboutInfo.json in a text editor.

```
{  
  "title": "About Me",  
  "name": "IcedMilk (or another name)",  
  "description": "Heyyy - it's me! This is my website. Read my stories. Also you  
  "siteDescription": "about.md"  
}
```

- 2.
3. Changing the title will change the main heading for this page.
4. Change the name/description to whatever you want. The description only changes the smaller paragraph next to the portrait/image of you.
5. To change the rest of the site description, open about.md in a text editor and change the markdown. This is also how I'm linking the contact info - you embed links with [display text](link). For a mailto link, I usually do [\[thermitefe8@gmail.com\]\(mailto:thermitefe8@gmail.com\)](mailto:thermitefe8@gmail.com). Obviously, swap out my contact info with yours.
6. To change the portrait, go to homeresources and edit portrait.png.
 - a. Keep this aspect ratio as square too.
